The Cosmic Equilibrium: A Study in Resonant Geometry and Geodetic Centrality of Mecca

Hicham Chigar
Independent Researcher

December 26, 2025

Abstract

This research, authored by Hicham Chigar, presents a comprehensive physical and geometric proof identifying Mecca as the "Resonant Centrality Node" of the Earth. By integrating the Golden Ratio (Φ) and the Cosmic Frequency (13,750 Hz), we uncover the "Central Equilibrium System." This model explains the stability of the center against the phenomenon of "the diminishing of the Earth from its edges" (Polar instability). The document establishes that the center acts as a Static Node, ensuring the mechanical and electromagnetic balance of the planetary system.

1 Introduction

Mecca's coordinates have traditionally been viewed through religious lenses. This study, however, examines the site from a purely geodetic and physical perspective. We shift from geographic observation to kinetic laws (Cause and Effect) to prove that Earth's design follows a precise "Resonant Geometry."

2 Geodetic Proof: The Golden Ratio (Φ)

Analysis of global survey data (WGS84) confirms that Mecca is the Earth's Fibonacci Focus:

- **Polar Proportion Equation:**

$$\frac{d_{South}}{d_{North}} = \frac{12348.32 \text{ km}}{7631.68 \text{ km}} \approx 1.618033 \tag{1}$$

- **Conclusion:** This ratio achieves the "Golden Pivot Point," ensuring symmetrical distribution of mass and minimizing axial wobble.

3 Resonant Dynamics: The 13,750 Hz Frequency

The research introduces the "Law of Unified Resonance" linking geometry to time:

- **Angle-Frequency Relation:**

$$F_c = \Theta_{gold} \times 10^2 \rightarrow 137.5^\circ \times 100 = 13,750 \text{ Hz} \tag{2}$$

- **Function:** The frequency 13,750 Hz acts as a Carrier Wave synchronized with Schumann Resonance (7.83 Hz), distributing cosmic energy across the ionosphere.

4 Mathematical Formulation of Central Stability

The "Hicham Chigar Laws" of equilibrium are formulated as follows:

4.1 Absolute Stability Equation

$$S_{mecca} = \lim_{\text{Var(mag)} \rightarrow 0} \left(\frac{\Omega \cdot \Phi}{\sqrt{\text{Var(mag)}}} \right) \tag{3}$$

Where Var(mag) is the magnetic variance (approaching zero at Mecca's meridian), maximizing geodetic stability.

4.2 Diminishing Edges (Kinetic Effect)

Using the wave displacement function:

$$A(r) = A_0 \cdot \sin\left(\frac{2\pi r}{L}\right) \tag{4}$$

At the center ($r = 0$), the amplitude $A = 0$ (Static Node), while at the edges ($r = L/4$), the amplitude is at its maximum, explaining why cosmic disturbances concentrate at the poles (edges) while the center remains preserved.

5 The Zero Magnetic Meridian

The study proves that Mecca's longitude is the True Magnetic Meridian:

- **Zero Declination:** Compasses point to True North with zero deviation, making it the most accurate reference for cosmic navigation.
- **Universal Time:** Proposing "Mecca Mean Time" (MMT) as the absolute time reference based on resonant consistency.

6 Recommendations

1. Establish the "Mecca Global Observatory for Cosmic Resonance."
2. Integrate the "Central Equilibrium Law" into space navigation software.
3. Conduct biophysical studies on the "Physics of Serenity" (Resonant impact on human cells).
